Bilingualism in Parkinson's disease. A higher degree of bilingualism has been reported in healthy subjects, but the influence of bilingualism in neuropsychological tests in Parkinson's disease (PD) is unknown. We examined the effect of Spanish-English language use in a group of PD patients. Participants were divided into Spanish-English (n = 24) and English monolingual (n = 22) groups. The demographic characteristics of both groups were similar. Spanish-English participants performed better than the English monolinguals in measures of verbal fluency, Stroop, and verbal recall. There were no differences in cognitive functions between the two groups of PD patients. The results are discussed with reference to the cognitive and neural processes underlying the maintenance of the bilingualism.\* Editorial: 'This is how you play in Astoria: the world is your ball.'
