Chiral liquid crystals composed of trans-1,2-dimethyl-4-hexyl cyclohexane. The chiral liquid crystal phase was attained through trans-1,2-dimethyl-4-hexyl cyclohexane (HDMH) mixing with the chiral liquid crystal polymer Cholesteryl derivative A1 (CDA1). The chiral liquid crystal as a guest material was added into CDA1 and the mixture was heated at 80 degrees C under a shearing field of $\tau = 100 \text{ s}^{-1}$ in vacuum. The equilibrium concentration of the chiral liquid crystal in the Cholesteryl derivative A1 (CDA1) was estimated to be approximately 6 mol% based on NMR and X-ray diffraction analysis. The chiral liquid crystal was observed in a nematic mesophase. Q: How to update the location of the iPhone simulator without rebuilding the project? I'm using the iPhone 4 Simulator on Xcode 3.2.3 with Mac OSX 10.6. I use a fair amount of view-based animations (in particular rotation and scaling) and Xcode is really good about animating the view changes when I resize it, but I'd like to be able to view the results in the actual application. Is there any way to update the location of the simulator while the application is running, without the need to recompile the app? A: Use Xcode's "simulate development environment" button when you launch Xcode. This will start the simulator with your project settings, but also add the debugger to it. From there, you can use your regular breakpoints and whatnot. Kintore, Victoria Kintore is a town in Australia, within the Shire of Central Goldfields, in the Goldfields-Esperance Region of Western Australia. It is located within the Shire of Chittering. The town's name derives from a pastoral run that was named after the type of kauri used by the Mowle family. Field of the Invention The present invention relates to an organic electroluminescence display device, and more particularly to an organic electroluminescence display device capable of preventing deterioration of an element structure. 2. Description of the Related Art Generally, an organic light emitting device generates a light of a high brightness by the combination of the electrons and the holes. Recently, an organic light emitting device that is a self-light emitting device ("OLED" hereinafter) has been paid attention due to its characteristics that it is an ultra thin device and consumes low power. The OLED has been applied to the display fields of various information processing devices such as computers and mobile phones. The OLED includes a hole injection electrode, an organic light emitting layer and an electron injection electrode that are sequentially formed between the anode and the cathode. Also, the OLED emits a light by the energy generated when the hole and the electron provided from the anode and the cathode, respectively, are combined in the organic light emitting layer. The driving methods of the organic light emitting device may be classified into a direct current driving method and a voltage driving method according to a power supply voltage applied to the OLED. In the direct current driving method, constant current is supplied to an OLED to flow a constant current through the OLED so that a constant brightness is displayed. Also, in the voltage driving method, a voltage is supplied to the OLED to flow the constant current through the OLED so that the OLED emits the light. The voltage driving method uses an OLED with a low forward voltage in a flat panel display such as a liquid crystal display ("LCD" hereinafter) or an organic light emitting diode display ("OLEDD" hereinafter). Also, in the OLEDD, driving circuits are formed on one of two panels such that the OLED is driven by a low voltage. The voltage driving method is the best method for a portable flat panel display. The organic light emitting device of the voltage driving method is advantageous in that it is driven by a low power and is excellent in view of high color gamut and brightness. However, the organic light emitting device of the voltage driving method is not suitable for a large panel display 595f342e71
