In 1988, a few months before the launch of a video game called Q*bert, designer Sid Scott (Steve Purcell) was in his basement, tinkering with an old Pong machine, no doubt trying to find a way to make his version of the classic game even better. That's when he invented Q*bert, a fast-paced 2D adventure where you played as a perpetually befuddled and woefully short little robot trying to get from one end of a maze to the other, while avoiding assorted carnivorous and otherwise

grotesque objects. In 2014, Sid and his colleague Rick Maurer were wandering around the abandoned factories and buildings of Miami, when the thought occurred to Sid that Q*bert would make a great VR game. The two men, who you might know as the Sid and Rick Show from their site, Gameology, quickly realized that it would be a good way to bring that 1984 arcade game into the modern age, while also introducing a whole new set of players to this enigmatic character. Analyzing the Effects of the Social Norms on the Expenditure of Bid Wage Prior to the Auction Abstract: This paper studies the effect of social norms on the expenditure of bid wages prior to the auction. It is assumed that inefficiencies in the auction arise from deviations from social norms. In particular, we study the effect of social pressure on the probability of bidding and the size of the bid for a given asset. We derive some theoretical results, which show that these deviations lead to higher or lower bidder's costs. We perform an empirical analysis of data from the Greek and Belgian auctions of the Greek financial crisis in 2010. By estimating a social norm game model, we show that bidding costs significantly increase when buyers face social pressure and that deviations from the social norm significantly lower the probability of a bidder to bid.[Treatment of acute encephalitis with high-dose IVIG]. Intravenous immunoglobulin (IVIG) is the first-line treatment of acute encephalitis. The efficacy of IVIG remains to be proven, especially in high-dose IVIG (HD-IVIG). To assess the efficacy of high-dose IVIG for acute encephalitis, we retrospectively evaluated the results of treatment of 25 patients with high-dose IVIG (IVIG(1) group) and 22 patients with conventional dose IVIG (IVIG(2) group) in Osaka City University Hospital between 2001 and 2011. There was no significant difference between the two groups in the background. Survival rates at 1, 3, 6, and 12 months were comparable between the two groups.
