How to unlock bootloader. Huawei Honor 3D Specifications Huawei, the consumer, banking, enterprise and IoT company for innovation. How to unlock bootloader on Honor 9X. How to unlock bootloader on Honor 9X.Q: geom_point size based on y axis value in ggplot2 How can I make the size of a geom_point based on the value of y axis? For example, I am plotting two sets of data from two different countries, A and B. For country A, the data are grouped based on a year range (from 2013 to 2018) and the standard point size is displayed. But for country B, the data are grouped from 2014 to 2018, and I want the size of the data points to be less. So this is the current code: ggplot() + geom_point(aes(x = Nation, y = year, fill = country, size = data)) + scale_size_continuous(range = c(6,12)) I got some of the solution, but it is not a perfect fit. The size is set to maximum (12) only for the first year, and maximum for the remaining years. But the second issue is that I want the size of data points to start increasing as the country is changing to B. So, for example: The size of data points for country A is 6, while the size of data points for country B is 14.

The size of data points for both countries are the maximum possible value. I need to adjust the size of the points. A: We can do what we usually do when we have a continuous variable (i.e., size) in a plot, and take advantage of the ordinal = FALSE argument in scale_size_continuous(). ggplot(d, aes(x = year, y = data, fill = country, size = data)) + geom_point() + scale_size_continuous(range = c(4, 8),
