The word has various shades of meaning, depending on the context in which it is used: it means both "union" and "method" in practice. The effect of morphine withdrawal on morphine-precipitated characteristic flinching in rats. Characteristic flinching was precipitated in rats by the intraperitoneal injection of 10 mg/kg morphine. During the chronic administration of morphine, characteristic flinching was inhibited dose-dependently by the co-injection of morphine (10, 20, 50 mg/kg). During the acute withdrawal of morphine the morphine-induced characteristic flinching was enhanced dose-

dependently. The possible reason why morphine withdrawal enhances the morphine-induced characteristic flinching was discussed.

Q: Converting array to bit mask - Golang I'm currently doing authentication on some accounts. I have this logic to check if the password is valid:

```
var validLogin = false
var username = "foo"
var password = []byte("bar")
if username == username && password == password {
    validLogin = true
}
```

It was suggested to me that the code above should be written as a function instead. That would be:

```
func ValidLogin(username, password string) bool {
    if username == username && password == password {
        return true
    }
    return false
}
var validLogin = ValidLogin(username, password)
```

My question is, how do I change my current method so that I can apply a bit mask to validLogin? Currently I'm using this `e79caf774b`

Field of the Invention The present invention relates to a liquid level sensor for determining liquid level in a tank, such as fuel oil in a fuel tank of an automotive vehicle. 2. Description of Related Art According to JP-A-1-293076, a storage tank such as a fuel tank includes a float connected to a liquid level. The float is disposed above the liquid level and a sensor is disposed beneath the liquid level. The sensor is connected to a sensing circuit that generates a sensing signal. A tank cap is placed on the storage tank to prevent intrusion of foreign matter. The tank cap includes a port having a drain hole. The drain hole communicates with a duct that extends in the cap. When the liquid level of the storage tank rises, the float is lifted to lower a bulb portion of the storage tank. The lift of the float is detected by a mechanical or electromagnetic force. With a conventional liquid level sensor, however, the sensor is disposed beneath the liquid level. Consequently, the volume of the storage tank must be large enough to accommodate the liquid level. This results in a problem

that the size of the liquid level sensor becomes large. According to the liquid level sensor, there must be a space between the vehicle body and the liquid level sensor.
