Electronic devices, telecommunications, computers are used commonly. The penalties in the US are not that harsh. A fine and/or jail time. Computer law is more complex than US computer law. This invention relates to the field of spring latch mechanisms and more particularly to latch mechanisms which are easily adjustable. Latch mechanisms are used in a wide variety of applications, some of which require a latching structure to be readily adjustable to accommodate variation in the size of the objects to be held in the latching mechanism. For example, it is often desirable that the position of the latch in a door mechanism be readily adjustable to allow for compactness of the door, low profile of the door and/or reduce manufacturing costs. In another example, an adjustable latch mechanism allows the door to remain open to serve as a back up in the event of a power outage. With the expectation of power outage, an adjustable latch allows the door to remain open until the power is restored. In the adjustable door latch application, it is desirable that the adjustable portion of the latch mechanism be simple to operate, yet secure against intentional or inadvertent opening of the latch. Thus, there is a need for an adjustable latch mechanism which is safe and provides for adjustability of the position of the latch mechanism. The present invention is directed to an adjustable latch mechanism having an adjustable side wall latch which also serves as a safety lock. In the adjustable side wall latch, the adjustable side wall latch serves as the locking mechanism when the adjustable latch is closed, while the adjustable side wall latch also functions as the adjustable portion of the latch mechanism. The adjustable side wall latch allows the distance between the side wall and latch point to vary, enabling the adjustable latch mechanism to be compact and provide for an open position to serve as an alternate power source. In one embodiment of the adjustable side wall latch, the adjustable side wall latch is spring loaded and thus automatically returns to its preloaded position. In another embodiment, the adjustable side wall latch may be positively engaged by a cam lock to prevent the latch from being unlatched unintentionally. In yet another embodiment, the adjustable side wall latch comprises a first member (preferably a hook) and a second member (preferably a jamb plate), which allows a variation in the distance between the latch point and the side wall. As used herein, the term ambient air is intended to refer to fresh air contained within a structure such as a
