from an aesthetic standpoint, the removal of old paint from a building's exterior will have a limited effect on the building's historic character. the removal of paint might even improve the appearance of a building, since the paint layer can be removed by sanding or scraping without damaging the wood, and the appearance of the building can thereby be improved. further, since the paint layer generally consists of a very thin layer of paint, it may not even be visible from a distance. the removal of paint will, however, remove any protection from the wood to the extent that it might enable damage from the weather, such as that caused by woodpeckers or termites. if conditions warrant, repairs to any damage resulting from weather may be required prior to repainting. if it is desirable that the structure be repainted, it is advisable to consider the building's color scheme and to select a new color based on that scheme. for example, a bright primary color such as red would be preferable if the building has a yellow or brown color scheme, while a dark neutral color would be a good choice if the building has a red or blue color scheme. it is also important to understand that while paint might be a convenient way to disguise problems that might otherwise appear to be more damaging (such as a cracked or weathered wall), it is not an acceptable solution to prevent or even correct other problems or damages. for example, while paint is generally considered to be a fairly effective way of protecting a wall from a termite infestation, the insect will continue to tunnel even through the protective coat. the protective coating is therefore an appropriate means of protection only until the building is repaired or restored.

once these areas of maintenance have been identified, the owner or manager should: plan the project for maximum efficiency. clean, inspect, and evaluate all surfaces of the building. identify all areas that might be damaged. know the extent of the work required. document the work. understand the building's electrical systems. identify areas in the building that might require rewiring. identify areas of the building that might require re-finishing. in the absence of a comprehensive maintenance program, the interior of an historic building can easily become a theater for the deterioration of one or more of its systems. the electrical system is among those most vulnerable. exterior moisture, which can be readily absorbed through the outer layers of paint, often penetrates the wood frame, causing rot, fungus, and, ultimately, electrical shorting and eventual failure. further, outside air temperatures above freezing, and internal condensation can cause interior moisture to accumulate, causing the same problems. the only effective approach to maintaining an interior electrical system requires a thorough understanding of the building and maintenance history of the property, an understanding of the effect of physical changes in the building on electrical systems, and a commitment to regular maintenance. while the best current practices for maintaining electrical systems require a thorough understanding of the building and maintenance history of the property, owners of historic properties can still benefit from knowledge of the history and current state of their own buildings. many historic properties, such as those with an on-site electric utility, have been maintained for decades without the benefit of professional assistance. in many other cases, the owner or manager is often the only person with a detailed knowledge of the building, its history, and its maintenance practices. this ability to apply common sense and problem solving skills can be invaluable to an owner when undertaking the inevitable "fix-it" problems of an historic property. 5ec8ef588b
