I have been testing iriver's new H10N and it seems that it's interesting product. It's not only one of the most portable mp3 players, but it's also one of the most capable mp3 players at the moment. Moreover, if you found this review useful then it would be great if you could share this page with your friends because it doesn't cost any extra effort. From their webpage : If you're a developer you know that you can't modify or add new functionality to the C# class files associated with Photoshop documents because they're sealed - they're compiled into a binary format and can't be modified. Well, Photoshop Lightroom makes it easy. Simply open a Photoshop document and update the Lightroom project file with your edits. Or, if you'd like to modify this application on your PC, you can keep your changes in your project file and import them into relevant Lightroom projects. "Up to 7 pixels of light can be captured" : Photographers are constantly looking for ways to maximize the use of our current tools to improve their work and performances. But so far all the efforts have been exclusively focused on improving the RAW processing without applying a single bit of light to the images directly. Now, there's a software plugin that offers "7 pixels of light" and "Photoshop will round off the white points and the black points". WPF Camera - Easy Photo Studio takes advantage of our latest DNG format which is considerably wider (95 bytes rather than 23) and, according to the developers, easier to tweak so that you can capture as much light as you can without feeling fooled by the white and black point adjustment. The interesting part is that this plugin can be used later on in any other Photoshop processing without the need to manipulate the preview image.

The Gradient tool allows you to use the color and shade capabilities of the Gradient panel to retouch photos and create powerful effects. Choose from 20 brush presets and create your own custom gradients. With the Gradient tool, you can control the color, blending, and opacity of the resulting gradient. You can change the direction of the gradient, the color of each section of the gradient, and even the direction at which the gradient is reflected. The Levels tool allows you to make your photo look like it was taken with a camera with a different white balance. Use this tool to make your photos look natural and to make changes to the brightness and dark areas of the photo. The Clone Stamp tool lets you quickly and easily remove blemishes and other flaws from your photos. Simply create a new layer above your original image with the Clone Stamp tool, and then hit "replace" on the menu bar. **What It Does:** The Liquify tool puts the spotlight on the type of action you want to create. For starters, you can use this tool to distort your photos, allowing you to make them look like they were taken with an action camera. **What It Does:** The Paths tool lets you create specialized effects that are not possible with normal layer tools. Create a new path, and then apply the desired effect. You can then duplicate the path and move it around on the canvas for even more complex effects. Over the last three years, Chrome has been working to empower web applications that want to push the boundaries of what's possible in the browser. One such web application has been Photoshop. The idea of running software as complex as Photoshop directly in the browser would have been hard to imagine just a few years ago. However, by using various new web technologies, Adobe has now brought a public beta of Photoshop to the web. Buffer Usage: The Buffer usage window is shown in Figure 3.1 on Page 85, and is used to see what photos in a project will consume memory when opened. The rest of the Aspects and Components show how memory consumption varies from exposure to exposure. **Meta data:** Metadata can be interpreted as an accompanying idea for your image or a piece of information such as the place where the image was shot or the name on the image. Meta data can be accessed directly through the Metadata palette. Figure 10.1 on Page 130 shows how the View Layers palette can show the metadata associated with a mask created in the Layers palette. You can also create Meta objects for any of the items in the metadata palette (see E.9 on Page 77), or you can create metadata trails for a selection set or even mask. **Masks:** Masks allow you to mask parts of an image and work with only the masked parts of the image, just as a camera blackout allows you to work with the final image. In Figure 7.6 on Page 66, we see an instance of this in the layer mask that was made on page 71. In Chapter 10, you will learn how to work with more than one mask on a single layer at a time in Elements 12. The Mask palette can be used to view all the masks attached to the active layer in the Photo Editor. Figure 10.3 on Page 95 shows how you can select and mask portions of an image while the rest of the image stays in place.
