What's New in the?

OldChromeRemover is intended to solve the problem of installing Google Chrome versions that can end up being redundant in the long term. It is a utility tool that can check for the presence of various versions of Chrome and then have them removed from the computer's hard disk. It makes use of the scanning feature of Google Chrome and checks for leftovers of the latter in the 'AppData' folder. This folder is a well-known storage location for Chrome and its corresponding files. There, it scans for files that could be related to the different versions of the web browser, including Canary builds. Once detected, these files are presented to the user in order to let him decide whether he wants to have them deleted permanently or just marked as unused. The utility does not interfere with the operation of Google Chrome, but it can be useful for freeing up disk space, since the application is capable of discovering and eliminating leftovers of the browser, regardless of their storage location. Scanning for redundant files in the 'AppData' folder is much more efficient than manually looking for them and could have considerable advantages in terms of time and

resource usage. Note: This is a freeware utility that does not require any installation procedure. Installing the software is optional, but it might come in handy to have the necessary data available at all times. The program can also be used as an uninstaller, but it requires the existence of the folder it scans. The application is absolutely safe and does not have any intrusive elements. The input box can be set to display or not the 'Important notice' message at the beginning of the scan. The user can toggle the warning status manually by clicking the button. When it is active, this message warns the user that he should not perform a manual search on his computer. 'OldChromeRemover' has a command line console which can be accessed through the application's main window.
