As I said, Lightroom 5 brings quite a number of features. Among them, I would like to touch upon two: "Envelope" and "World Map." These two features will be of great importance when using Lightroom software to create high-quality wedding albums or travel photo albums. As a photographer, I need a tool that makes it easy to work with RAW files from my cameras. Now, Lightroom is one of those tools, but Adobe should have also provided a Camera RAW plugin that could do all my editing in-house. That's just a minor complaint. Lightroom is a really powerful photo editing tool and a real blessing for photographers. It's a perfect match for those who love writing scripts and know how to work with compositing programs. However, for that, you will need some in-depth knowledge of Photoshop, which is no problem, but not everyone will want to get into it. It's for those people that Photoshop CC is perfect. You don't need to know how to use photomosaics and you don't need to know what a lens correction is if you just want to work with RAW files without any extra plugins. Lightroom will read and process your files non-destructively and you will be able to always go back, no matter what. Not only that, the new version of Lightroom is just nice and stable while being updated, it works great on both Mac and Windows and there are a lot of different people that love it. And this doesn't even account for the fact that it's the perfect tool for someone that uses Adobe Lightroom as a cataloging system for their digital archive. This is how Lightroom works best.

Photoshop will receive a major feature update in coming months that will bring great 3D features in its Creative Cloud experience. We will discuss this update shortly, in addition to the timeline of the planned retirement of Photoshop's complete 3D feature set. With the retirement of the 3D feature set, Adobe will be looking to take advantage of native OpenGL capabilities to provide additional performance for the end user. Thus, we'll be focusing efforts on stabilizing this API and adding broad support for several additional features such as: We'll continue to look into adding OpenType contextual ligatures, Typekit support, as well as additional renderer and viewer support as the GPU API matures. And of course we'll be working to support and utilize features and filter libraries that can be applied to true 2D images, such as those from the new Substance UI. In addition, in the past few months we've greatly enhanced the performance of our 2D text and text editing tools, in addition to improving the performance of text meshes and text meshes that are edited with the pen tool. Rather than

focusing on delivering a successor to After Effects as a native GPU-based video editor, the team will be working on improving the performance of the current timeline in Photoshop. We'll increase the amount of time that a user can split up a clip and perform edits on each half before needing to create a new clip. We'll also be looking at ways to speed up the user experience throughout the editing timeline itself, such as giving users more precise control over the rendering order of layers and easing the drop down menu interaction for layers that are more complex than simple fills and strokes.
