All in all, I'd say that the new Photoshop was a worthy update. Not perfect by any means, but definitely not as lo-fi and underwhelming as some have made it out to be. The new interface is actually pretty smooth. And for the first time, I get the impression that Adobe has really heard the complaints. The biggest new feature for me is the ability to import and work with existing Lightroom and Photoshop libraries. That's a definite plus for me, and has me excited about the future. Browsing in the Finder is much simpler than before. Simply tap on the tab bar at the top of the screen to open the relevant folder. This also makes it much easier to access files while working in Sketch. Selecting a file is easy and you can display all the other images in the same folder by tapping a white file icon to the left of an image. Sometimes the system displays a grey error icon in the corner when all you would like to do is view an image. In this case it might be just a matter of waiting a moment and selecting the image again. Now I can't do much about the quality of the images I use to create my artwork. I'm far too used to Adobe's Post-Producing and Rasterizing toolset. I simply use Photoshop Pro, along with the tools I get with my license, to resize and enhance images for print. Using Photoshop Sketch to convert vector/curves data to raster files seems to work well. I have even been able to apply Ready layer masks to objects in Photoshop Sketch without losing the original object data in my files. I could not do the same if I used Photoshop while using the Pencil. Changing brush modes is a little simpler too, without having to go into the tools panel.

The benefits of Lightroom you'll use in the majority of situations are number one: it's a more streamlined, self-contained workflow. It's a little bit easier to use, and it doesn't throw up as many roadblocks in terms of file size. The two programs are better matched for different scenarios. That said, Photoshop is clearly still the mother of all design programs, especially when it comes to high-end photo editing. There are tons of the tools you've been exposed to; you don't need Photoshop to organize and manipulate them. When you go with the Creative Cloud for Photoshop,

you get access to the cloud and a library of services that include: digital creation suite, cloud storage, and the web app where you store and create your work. In 2010, we recognized that the web needed a vector graphics editor that would give web designers the tools they needed to accelerate the creation of their designs and make the web less dependent on Flash. We found it to be an achievement to make Photoshop vector graphics work in the browser. The odd thing about Photoshop is that although it is quite the robust, it does lack certain features that other design apps may have. It is not as robust as a GIMP and there is not as fast the a vector editing app. Photoshop does have several unique tricks that other design programs may lack. With a sizable 'Photomerge' tool, you can take several different photos of the same image and combine them together into a single file. Another unique function is the 'Image>Paintbrush' tool, which allows you to change the entire color of an image from one spot to another. In GIMP, you would have to do it pixel-by-pixel. All these features are quite the impressive ones when compared with another design program. e3d0a04c9c
